

Tutorial 1 - AI as a Morning Operations Desk

Turn ad-hoc prompts into a repeatable premarket workflow for students.

Session anchor: April 23, 2026 session: AI assistant, prompts, catalyst scan, Perplexity news, and daily note capture.

Audience	Students building a daily market routine before and after the open.
Last updated	April 23, 2026
External depth	Official OpenAI and Perplexity product documentation added to the session workflow.

What students should be able to do after this tutorial

- Separate AI into jobs: scheduler, researcher, translator, verifier, and journaler.
- Create a repeatable morning brief that arrives before the market gets noisy.
- Write prompts that ask for sources, timestamps, and uncertainty - not trade calls.
- Build a review loop so the student can improve prompts over time instead of collecting random notes.

Session translation note

The coaching session used the language of "workers" and "Pulse." Teach the durable idea, not the temporary label: scheduled tasks, structured prompts, source-aware research, and a disciplined review loop.

1. Why this tutorial matters

In the session, AI was used for on-screen assistance, recurring prompts, translation, note capture, and a morning catalyst scan. That is the right instinct. The upgrade for students is to stop treating AI as a magic oracle and start treating it as an operations desk.

A real operations desk has clean jobs. One process gathers the calendar. Another gathers overnight news. Another translates or simplifies difficult language. Another verifies sources. Another turns the day into notes the student can review after the close. When those jobs blur together, students drown in noise and mistake output volume for edge.

Current product reality

OpenAI currently documents **Tasks** for one-off and recurring runs, and for eligible business or enterprise workspaces it documents **workspace agents** that can connect to apps and run on a schedule. Perplexity now documents a **Computer** layer and recent Finance updates such as analyst ratings and auditable financials with SEC links. Use those official capabilities as the external complement to the original coaching workflow.

2. The five jobs students should assign to AI

Job	Purpose	Good output	Common failure mode
Scheduler	Runs the same brief at the same time every day	A briefing arrives before the open with the same structure each time	Student keeps typing fresh prompts and never compares days
Researcher	Pulls macro, company, and watchlist context	Sources, timestamps, upcoming catalysts, and unknowns	Long essays with no source hierarchy
Translator	Simplifies technical language or translates into the student's preferred language	Short plain-English definitions and examples	Turns precise terms into vague summaries
Verifier	Checks claims against primary sources	SEC filing, exchange notice, company IR, or official docs	Repeats social media or secondary summaries
Journaler	Stores the day's thesis, observations, and mistakes	End-of-day summary with what changed and why	No record of what was learned or what failed

3. Build the morning desk in this order

Step 1 - Define the minimum useful brief

A beginner brief should answer only four questions: What events matter before the open? What moved overnight? What is scheduled in the next few hours? What still needs verification?

Step 2 - Schedule the jobs

Use one recurring task for the premarket brief, one for a midday risk check, and one for an end-of-day journal. Do not start with ten automations. Start with three and make them dependable.

Step 3 - Force source discipline

The prompt should explicitly ask for primary or official sources first. If the system cannot verify a claim, the output should say "unverified" rather than guess.

Step 4 - Add the student's watchlist

Attach the student's symbols, sectors, and instruments only after the briefing format is stable. Otherwise the model becomes a ticker firehose.

Step 5 - End with a review loop

Every afternoon, the student should compare the brief against what actually moved the market. This is how prompts become better and shorter over time.

4. A practical schedule students can copy

Time (local)	Task	What the student gets
06:45	Catalyst scan	Macro calendar, company headlines, overnight movers, and items that still need checking
07:20	Watchlist brief	Only symbols on the student watchlist with levels, catalysts, and a sentence on why they matter
09:15	Pre-open checklist	What changed since the early brief, plus any exchange, earnings, or filing updates
12:00	Midday manager	What thesis survived the open, what invalidated, and what can be ignored
16:15	End-of-day journal	What happened, what the student did, what the student missed, and one improvement for tomorrow

Why this order works

It front-loads only the information the student can act on, then shifts to review. The goal is not to keep the student busy all day. The goal is to make the student arrive prepared and finish the day with a cleaner process than they started with.

5. Prompt templates students can start using now

Premarket catalyst brief

Every weekday at 6:45 a.m. local time, build a premarket brief for my watchlist. Include: 1) macro events in the next 6 hours, 2) company-specific catalysts, 3) overnight movers, 4) source links, 5) what remains uncertain. Keep it to one page and do not give trade recommendations.

Translation / simplification

Explain the following market note in plain English, in five bullets, with one short example per bullet. Keep the original technical term next to the plain-English translation.

Verification prompt

Check each claim below against a primary or official source. Label each line as verified, unverified, or disputed. If verified, cite the official source first.

Midday manager

At 12:00 local time, summarize what changed since the open. Separate: 1) still valid, 2) invalidated, 3) ignore, 4) watch for later. Keep the tone operational.

6. The verification ladder students should memorize

1) Check the timestamp. Old news kills good process. 2) Check the venue. A futures headline and a cash-equity headline are not the same. 3) Check the primary source. Company IR, SEC filings, exchange notices, and official product docs beat summaries. 4) Check whether the output is reporting a fact, an estimate, or an opinion. 5) Check whether the output contradicts your prior brief.

This ladder matters because modern AI tools can retrieve a lot of information quickly, but the student still owns the final decision about what is trustworthy. The best morning desk removes random searching. It does not remove judgment.

7. Practice assignment

For five trading days, run the same three tasks: premarket brief, midday manager, and end-of-day journal. Do not change the prompt structure during the first two days.

On day three, shorten whatever is too verbose. On day four, add one verification rule. On day five, compare all five outputs and decide which parts actually changed student behavior for the better.

Completion standard

A student passes this tutorial when the morning brief is short, repeatable, source-aware, and useful before the market gets noisy. If the brief still feels like random browsing, the workflow is not yet a desk.
