

Trend Quality Pine Screener Pro Tutorial

Installation, configuration, screener workflow, and interpretation guide

Version	Prepared	Deliverables
v2.0 Pro	April 24, 2026	Whitepaper, tutorial PDF, and Pine v6 source file

This tutorial explains how to install the upgraded Pine v6 script, configure it in TradingView, run it in Pine Screener, interpret the columns, and tune the thresholds for different watchlist workflows.

Primary output file: **Trend_Quality_Screener_Pro_v2.pine**

Before You Begin

You need access to TradingView Pine Editor and Pine Screener. Pine Screener uses plots and alert conditions from an indicator as filters and columns, and its custom indicator scripts must respect request.* limitations [1]. The Pro v2 script was built specifically around those constraints.

Important: this is a screener. It does not backtest, submit orders, or decide position size. Use it to produce a better watchlist, then review charts, earnings dates, risk, and trade plans separately.

Step 1 - Install the Source File

- 1 Open TradingView and go to the Pine Editor.
- 2 Create a new indicator script.
- 3 Open the delivered file `Trend_Quality_Screener_Pro_v2.pine` and copy the entire source into Pine Editor.
- 4 Save the script. Suggested name: Trend Quality Pine Screener Pro.
- 5 Click Add to chart. It will appear in a separate pane because overlay is false.

The script uses Pine v6 and `calc_bars_count = 500`. This aligns it with Pine Screener behavior and supports the default lookbacks used by the model [1][2].

Step 2 - Confirm the Inputs

Open the indicator settings. Inputs are organized into six sections so you can tune the screen without editing code.

Input group	What to configure
01. Trend Template	Fast/mid/slow SMA, slope lookback, and 52-week position filter.
02. Relative Strength and Market	Benchmark symbol, RS lookback, minimum relative-strength threshold, optional benchmark trend.
03. Liquidity and Volatility	Average dollar volume and max ATR percent risk filter.
04. Fundamental Overlay	Use or disable fundamentals, missing-data policy, Piotroski, EPS, and revenue thresholds.
05. Entry Trigger	Setup-only, breakout, pullback, or either entry style.
06. Output and Scoring	Diagnostic plot toggle for extra screener columns.

Step 3 - Run It in Pine Screener

- 1 Open Pine Screener.
- 2 Choose the watchlist you want to scan.
- 3 Select your custom indicator: Trend Quality Pine Screener Pro.
- 4 Choose a supported screener timeframe. The script itself requests daily data, so the intended workflow is daily scanning.
- 5 Add filters using the script plots. Start with Setup Pass = 1 or Trade Pass = 1.
- 6 Add visible columns such as TQ Score, RS vs Benchmark %, ATR %, Avg \$ Volume, Rel Volume, Piotroski F, and Status Code.
- 7 Sort by TQ Score descending, then review the charts of top candidates.

Because Pine Screener only displays values from plots that exist in the selected indicator, the script publishes all key diagnostics as plot outputs [1].

Step 4 - Interpret the Main Columns

Column	How to interpret it
Setup Pass	1 means all enabled setup filters pass. Use this for broad watchlist discovery.
Trade Pass	1 means the setup also meets the selected entry trigger. Use this for the action list.
TQ Score	Composite quality rank from 0 to 100. Higher is better, but still requires chart review.
RS vs Benchmark %	Positive values mean the symbol outperformed the benchmark over the RS lookback.
% From Fast SMA	Helps identify extension. A very high value may mean the stock is late or extended.
ATR %	Measures volatility relative to price. Higher values imply wider stops and smaller position size.
Avg \$ Volume	Liquidity filter. Thin symbols can pass charts but fail execution quality.
Rel Volume	Current daily volume divided by average volume. Important for breakout confirmation.
Status Code	If a symbol fails, this tells you the first failed category. 0 means pass.

Recommended Presets

Workflow	Entry mode	Suggested changes
Broad leadership watchlist	Setup only	Use RS ≥ 0 , 52-week filter on, fundamentals on, missing fundamentals pass if scanning ETFs too.
Strict growth/momentum list	Breakout	Use RS ≥ 5 , Piotroski ≥ 6 or 7, EPS and revenue growth > 0 , missing fundamentals fail.
Pullback watchlist	Pullback	Use max % above fast SMA around 3 to 5 percent and review price structure manually.
Small-cap research	Setup only or Either	Lower min avg dollar volume only if your execution size permits it; consider higher ATR risk control.
ETF or sector scan	Setup only	Turn fundamentals off or keep missing fundamentals pass; choose a benchmark that matches the universe.

Status Code Troubleshooting

Code	Meaning	Action
0	Pass	Candidate passed the configured mode.
1	Insufficient price data	Reduce lookbacks or remove symbols with limited history.
2	Trend failed	Stock is below key averages or averages are not aligned/rising.
3	Liquidity failed	Lower min avg dollar volume only if acceptable for your strategy.
4	Volatility failed	ATR percent is too high for the configured limit.
5	RS or benchmark failed	Check benchmark ticker string and RS threshold.
6	52-week position failed	Stock is too far from highs or not far enough above lows.

7	Fundamentals failed	Review missing-data policy and growth thresholds.
8	Market filter failed	Benchmark trend condition is not met.
9	Entry failed	Setup passed, but breakout or pullback trigger is not active.

Practical Workflow

- Run Setup Pass = 1 at the end of the day to maintain a leadership watchlist.
- Run Trade Pass = 1 when you want candidates with immediate trigger conditions.
- Sort by TQ Score, then verify price structure manually on the chart.
- For breakouts, confirm that relative volume is meaningful and not caused by bad data or one-off events.
- For pullbacks, check whether the pullback is orderly rather than a high-volume reversal.
- Review earnings dates, sector news, liquidity, spread, and risk before taking any trade.

Common Questions

Question	Answer
Why <code>input.string()</code> for benchmark?	Pine Screener ignores <code>input.symbol()</code> selections, so a text ticker field is safer for screener use [1].
Why only five <code>request.*</code> calls?	Pine Screener limits scanned scripts to five separate <code>request.*</code> calls [1]. The three financial calls are the main budget constraint.
Should I use SPY as benchmark?	SPY is a broad US default. QQQ can be better for growth/technology-heavy lists; IWM can be better for small-cap universes.
Do fundamentals work for ETFs?	Often not. Use missing fundamentals pass or turn the fundamental overlay off for ETF scans.
Can this be used intraday?	It is designed around daily requests and daily screening. For intraday logic, create a separate version and retest all assumptions.
Does a high score mean buy?	No. A high score means the symbol deserves review under your trading plan.

Mini Code Map

Use this map if you want to edit the source file later.

Section	What it does
Constants	Group names, entry mode labels, missing-data policy labels.
Inputs	All user settings, grouped for professional settings panel use.
Daily symbol request	One <code>request.security()</code> tuple with all daily technical values.
Benchmark request	One <code>request.security()</code> tuple with benchmark trend and lookback values.
Fundamentals	Three <code>request.financial()</code> calls. Do not add more if you need Pine Screener compatibility.
Filter logic	Trend, liquidity, volatility, RS, market, 52-week, and fundamentals.
Outputs	Plot columns for Pine Screener and alert conditions.
