

Trend Lines, Support & Resistance Pattern Playbook

Built from the linked video theme — “The ULTIMATE Beginner’s Guide to TREND LINES” — and turned into a practical study guide with custom chart graphics, pattern logic, and trade-setup recommendations.

- 8 custom chart graphics built to mirror trend-line support/resistance behavior
- Pattern-by-pattern recommendations: context, trigger, invalidation, and targets
- Quick decision rules for channels, retests, confluence, and false breaks

Prepared Mar 13, 2026

Theme source: linked YouTube video on trend lines as support/resistance

TREND LINES (Full Course)

The ULTIMATE Beginner’s Guide to TREND LINES

Converted into a support/resistance setup playbook.

How to Use the Guide

A practical way to read trend lines as dynamic support and resistance.

2

Uptrend line = dynamic support

Downtrend line = dynamic resistance

What this guide is for

What this guide is for. The linked video frames trend lines as forward-looking support and resistance tools. This PDF turns that idea into a structured playbook: what each pattern means, how to frame entries, where invalidation usually belongs, and when the setup should be avoided.

Core interpretation rules.

- 1) Anchor obvious swing highs or lows.
- 2) Treat lines as zones, not lasers.
- 3) Cleaner reactions usually mean stronger market memory.
- 4) Breaks matter more when followed by a retest or reclaim.
- 5) Horizontal overlap adds weight.

Execution mindset

Execution mindset.

- The pattern is the context; the trigger is the entry.
- Prefer edges of a structure over the middle of it.
- Place stops beyond the structure that should hold, not directly on the line.
- Scale profits into the next opposing boundary or swing point.
- When price action becomes messy, reduce size or skip the trade entirely.

Fast checklist.

- Is the larger trend still intact?
- Is the line obvious without forcing it?
- Is there a clear invalidation point?
- Is reward-to-risk still attractive from here?

Method note

Method note. The YouTube watch page itself was not directly fetchable in-browser here. This document was therefore built from the public video listing/title-description and corroborating technical-analysis references on trend lines, support/resistance, role reversal, breakouts, channels, and failed breaks.

1. Rising Support Line

Bullish continuation built around an upward-sloping demand line.

3

BULLISH CONTINUATION

Treat the illustrated line as a decision zone, then wait for the trigger.

Pattern logic

What it shows. A rising support line forms when pullbacks stop at progressively higher prices. That tells you buyers are still willing to step in earlier each time, so the line behaves like dynamic support.

Best context. Clean higher-high / higher-low structure, an orderly pullback, and at least two prior reactions. Confidence improves when the pullback slows down as it approaches the line instead of slicing straight through it.

Avoid when. The line is extremely steep, price has already chopped through it several times, or the next bounce would run directly into major higher-timeframe resistance.

Execution notes

Entry ideas. Aggressive: act on a rejection wick or strong response candle inside the reaction zone. Confirmed: wait for a bullish close or a break of the local micro swing high after the touch.

Invalidation. Below the prior swing low or below the support zone beneath the line; avoid placing the stop exactly on the line because trend lines behave more like areas than laser-precise levels.

Targets. First target = prior swing high. Second target = channel resistance or a trailing stop under higher lows.

Recommendation. Favor this setup when the trend line also overlaps an old breakout level or another support reference. Trend-line support/resistance playbook

2. Falling Resistance Line

Bearish continuation built around a downward-sloping supply line.

4

BEARISH CONTINUATION Treat the illustrated line as a decision zone, then wait for the trigger.

Pattern logic

What it shows. A falling resistance line connects lower highs and shows that sellers are defending rallies at progressively lower prices. In practice, it acts like dynamic resistance inside a downtrend.

Best context. Lower lows remain intact, the rally back into the line is weak or overlapping, and the touch happens away from major higher-timeframe support.

Avoid when. The market is stretched into a strong demand zone, momentum expands sharply against the downtrend, or repeated candles close above the line and then recover back below it.

Execution notes

Entry ideas. Aggressive: short into a clean rejection from the line. Confirmed: wait for the touch, then use the break of a nearby micro support level as the trigger.

Invalidation. Above the rejection high or above the resistance zone around the line.

Targets. Prior swing low first. Channel floor or measured move second.

Recommendation. This works best when the retracement is shallow and visibly weaker than the prior selloff. If the bounce is powerful, assume the line may need to be redrawn or may be losing authority.

3. Support/Resistance Role Reversal

A broken level often flips its role when price comes back to retest it.

5

BREAK + RETEST

Treat the illustrated line as a decision zone, then wait for the trigger.

Pattern logic

What it shows. Horizontal support that breaks can become new resistance on the retest; broken resistance can become new support. This is one of the most useful ways to turn a break into a structured trade instead of chasing the first impulse.

Best context. A clear level with multiple prior touches, followed by a decisive move through the level and a controlled retest rather than an immediate V-shaped reversal.

Avoid when. The break is tiny, immediately reversed, or occurs in the middle of noisy range conditions where the level has already been violated repeatedly.

Execution notes

Entry ideas. Let the break happen first, then wait for price to retest the old level from the opposite side. The preferred trigger is rejection on the retest, not the first fast break itself.

Invalidation. Back inside the old range or through the retest pivot that should have held.

Targets. The next obvious support/resistance level, the opposite side of the range, or a measured move based on the height of the broken structure.

Recommendation. If the retest is shallow and fast, the move often has better follow-through. If the retest stays inside the zone too long, odds of failure rise.

4. Ascending Channel

Parallel rising boundaries create dynamic support below and dynamic resistance above.

6

BUY THE EDGE

Treat the illustrated line as a decision zone, then wait for the trigger.

Pattern logic

What it shows. An ascending channel is a rising support line plus a roughly parallel upper boundary. The lower line marks pullback support; the upper line often behaves like a profit-taking or reversal area.

Best context. An orderly trend where price rotates between both boundaries instead of exploding vertically.

Avoid when. The channel is narrowing into a wedge, price is accelerating straight up, or you would be entering in the middle with poor reward-to-risk.

Execution notes

Entry ideas. Look for longs near the lower boundary after a reaction candle, reclaim, or small structure break back to the upside.

Invalidation. Loss of the lower boundary plus loss of the latest higher-low structure.

Targets. Scale partial profits before the exact upper boundary; price often turns just before it. Leave a runner only if momentum is strong enough to threaten a channel breakout.

Recommendation. Use channels for both entries and exits. Edge trades are better than mid-channel trades.

5. Descending Channel

Parallel falling boundaries frame rallies into resistance and drops into support.

7

SELL THE EDGE

Treat the illustrated line as a decision zone, then wait for the trigger.

Pattern logic

What it shows. A descending channel organizes a bearish move into two clean boundaries: the upper line acts like dynamic resistance and the lower line acts like dynamic support for short-covering or partial profits.

Best context. A downtrend or a bearish corrective structure where price keeps respecting both edges.

Avoid when. You are shorting directly into major support, or the broader chart suggests the channel is actually a bullish flag getting ready to break upward.

Execution notes

Entry ideas. Shorts are strongest near the upper channel line after a visible rejection. Countertrend longs are lower quality unless price first breaks the channel and then retests it from above.

Invalidation. Above the rejection high or above the channel top if the idea is a pure channel short.

Targets. Lower channel boundary first; extension only after a clean breakdown through channel support.

Recommendation. Use this pattern to keep expectations realistic: channels often move in measured swings instead of one-way crashes.

6. Counter-Trend Line Break

A small opposing trend line can mark the end of a pullback inside the main trend.

8

PULLBACK CONTINUATION Treat the illustrated line as a decision zone, then wait for the trigger.

Pattern logic

What it shows. Inside a strong uptrend, pullbacks often print a brief downward-sloping line. When that mini line breaks, the pullback may be ending and the main trend may be ready to resume. The bearish version works the same way in reverse.

Best context. The larger trend is still intact, the pullback is corrective rather than impulsive, and the break happens before major structure is damaged.

Avoid when. The pullback already broke the main market structure, or the “counter-trend line” is just random noise inside chop.

Execution notes

Entry ideas. Aggressive: take the break of the mini line. Confirmed: wait for the break plus a reclaim of the nearby minor swing high (or swing low in a downtrend).

Invalidation. Below the pullback low in an uptrend setup; above the pullback high in a downtrend setup.

Targets. First target = retest of the prior trend extreme. Second target = continuation leg measured from the pullback base.

Recommendation. This is one of the cleaner ways to join a trend without buying the very top or shorting the very bottom.

7. Confluence Zone

The highest-quality setups often appear where a trend line meets a horizontal level.

9

TWO REASONS, ONE AREA Treat the illustrated line as a decision zone, then wait for the trigger.

Pattern logic

What it shows. A trend line by itself is useful; a trend line plus a horizontal support/resistance level is stronger because two separate market references point to the same decision area. That overlap is the confluence zone.

Best context. Clean trend, clear level, and an overlap zone that is obvious enough to be seen quickly without forcing lines onto the chart.

Avoid when. The chart is cluttered with too many lines, the overlap is vague, or the zone has already been tested so often that it no longer stands out.

Execution notes

Entry ideas. Let price enter the overlap area, then require a trigger: rejection wick, reclaim, momentum shift, or break of the local structure away from the zone.

Invalidation. Beyond *both* structures, not just one of them.

Targets. Nearest swing high/low, opposite side of the active range, or channel boundary if one exists.

Recommendation. Confluence is best used as a filter. It should reduce your trade count while improving average setup quality.

8. False Break / Trap

10

A first break of a key line can fail fast when a strong trend is not actually finished.

RECLAIM > TRAP

Treat the illustrated line as a decision zone, then wait for the trigger.

Pattern logic

What it shows. In a strong trend, the first apparent break below support (or above resistance) can trap traders when price quickly reclaims the level and resumes the original move. The failed break becomes information in itself.

Best context. Impulsive trend, shallow penetration of the line, fast reclaim, and no decisive structural failure beyond the line.

Avoid when. The break expands hard through a major horizontal level, closes decisively beyond it, and does *not* reclaim quickly.

Execution notes

Entry ideas. Wait for the reclaim, then look for either a confirmation candle or a break of the minor counter-trend structure back in the original trend direction.

Invalidation. Beyond the false-break extreme; if price revisits and breaks it again, the reclaim thesis is weakened.

Targets. Retest of the trend extreme first, then an extension if the trap triggers a squeeze.

Recommendation. Powerful setup, but do not assume every first break is false. Use the speed and quality of the reclaim as the deciding evidence.

Quick Playbook

A compact process for turning a line on a chart into a structured trade idea.

11

1. Mark structure

Start with swing highs, swing lows, and obvious horizontal levels before drawing any diagonal lines.

2. Classify the environment

Decide whether you are looking at trend continuation, a pullback, a channel, or a potential reversal.

3. Wait for the edge

The best decisions happen near support, resistance, channel boundaries, retests, or reclaims — not in the middle.

4. Demand confirmation

Use a reaction candle, reclaim, break of local structure, or retest failure to confirm the idea.

Pattern summary matrix

Use this as the one-page memory aid. The first target is where you reduce exposure or reassess; it is not a promise that the market must reach that price.

Pattern	Bias	Preferred trigger	Invalidation	First target
Rising support	Bullish	Touch + rejection / micro high break	Below swing low / support zone	Prior swing high
Falling resistance	Bearish	Touch + rejection / micro low break	Above rejection high	Prior swing low
Role reversal	Either	Break, then retest failure or reclaim	Back inside old range	Next S/R level
Ascending channel	Bullish	Reaction at lower boundary	Loss of channel support	Upper boundary
Descending channel	Bearish	Reaction at upper boundary	Break above channel top	Lower boundary
Counter-trend break	Trend-following	Mini-line break + pivot break	Beyond pullback extreme	Prior trend extreme
Confluence zone	Either	Trigger inside overlap area	Beyond both structures	Nearest swing / boundary
False break	Reclaim with trend	Fast reclaim + confirmation	Beyond fakeout extreme	Retest of trend extreme

Sources & Limits

Where the guide came from, and how to use it responsibly.

Reference notes

1. YouTube search listing for the linked video: "The ULTIMATE Beginner's Guide to TREND LINES." Description snippet: trend lines connect price points and extend forward as support or resistance.
2. StockCharts ChartSchool — "Trend Lines" and "Support & Resistance." Used for confirmation logic, role of breaks, and the idea that trend-line breaks should be validated with other tools.
3. Investopedia — "Trendline," "Support and Resistance Basics," "Breakout," "Support and Resistance Reversals," and "Failed Break." Used for channels, role-reversal behavior, breakout confirmation, and false-break interpretation.
4. Interpretation note: chart patterns are probabilistic, not deterministic. The recommendations in this PDF are educational pattern-playbook guidance, not trade advice.

Use it well

Important limits.

- Trend lines and chart patterns are interpretive tools, not guarantees.
- A pattern improves decision quality only when the invalidation point is clear and reward-to-risk still makes sense.
- Higher-timeframe context, volatility, liquidity, and news can override any pattern shown here.
- Use this document as a study and review sheet, not as a standalone trading system.
